### Alert
The safety and efficacy of topiramate therapy in neonatal seizures is unclear. Consult a paediatric neurologist for further advice on dose recommendations.

Suspension: Shake well before using.

### Indication
Treatment of neonatal seizures refractory to other antiepileptic drugs.

### Action
Topiramate acts by reducing excitatory neurotransmission (glutamatergic synapse) preventing depolarisation by inhibiting voltage-gated sodium channels.
On the postsynaptic terminal, topiramate is an antagonist at the ionotropic glutamate receptors (AMPA and kainate).

### Drug Type
Anticonvulsant.

### Trade Name
APO Topiramate, Epiramax, Topamax, Tamate,

### Presentation
Topiramate 5 mg/mL in SyrSpend SF PH4 (suspension).
Topiramate 6 mg/mL in Oraplus/Orasweet or Orablend (suspension).

### Dosage / Interval
**Dose:** Begin at 1 to 3 mg/kg/day as a single (nightly) dose for the first week. The dosage should then be increased by 1 to 3 mg/kg/day at weekly or longer intervals to the recommended total daily dose of 5 to 10 mg/kg/day in 1–2 divided doses.

Daily doses over 10 mg/kg in infants over 1 month age have been studied and were generally well tolerated. The daily dosage should be given as two divided doses.

### Route
Oral

### Preparation/Dilution
Oral
Give undiluted.

### Administration
Oral: May be given with or without feed.
Shake well before using.

### Monitoring
Monitor side effects clinically (see adverse reactions).
Monitor renal function, serum bicarbonate and for metabolic acidosis at baseline and periodically during treatment.
Ammonia concentration in any infant with lethargy or vomiting.

### Contraindications
Hypersensitivity to any component of the product.

### Precautions
Antiepileptic drugs, including topiramate, should be gradually withdrawn to minimise the potential for seizures or increased seizure frequency.
May be associated with metabolic acidosis and heat intolerance – see monitoring.
Use with caution in renal and hepatic impairment.

### Drug Interactions
Concurrent use of topiramate with several antiepileptic drugs [valproic acid; phenytoin; carbamazepine; phenobarbital] may result in decreased topiramate concentrations. Concurrent use with valproic acid may increase risk of hyperammonaemia, encephalopathy and hypothermia.
Concurrent use with CNS depressants [opioids] may increase risk of CNS depression.
Concurrent use with hydrochlorothiazide may increase topiramate concentration.
Concurrent use with diuretics causing hypercalciuria may increase risk of nephrolithiasis.

### Adverse Reactions
There is currently insufficient evidence on the safety of topiramate in neonates. From the few data available, it appears well-tolerated.

Common [reported in all populations]:
- **Dermatological:** Flushing (Paediatrics 5%);
- Endocrine/metabolic: Serum bicarbonate abnormal (25% to 67%);
- Gastrointestinal: Loss of appetite (10% to 24%), weight decreased (4% to 21%);
- Neurological: Confusion (3% to 11% ), dizziness (4% to 25%), impaired cognition (2% to 7% ), impaired psychomotor performance (2% to 13%), memory impairment (3% to 12%), paraesthesia (1% to 51%), reduced concentration span (2% to 10%), somnolence (6% to 29%);
- Psychiatric: Feeling nervous (4% to 16%), mood disorder (4% to 11%);
- fatigue (6% to 16%);
- Other: Fever (1% to 12%).

Serious [reported in all populations]:
- **Dermatological:** Erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis;
- Endocrine/metabolic: Hyperammonaemia (adolescents, 26%);
- hypohydrosis, increased body temperature, metabolic acidosis;
- Hepatic: Liver failure;
- Neurological: Drug-induced encephalopathy;
- Ophthalmic: Glaucoma, myopia, visual field defect (epilepsy, 0.1% to 1%);
- Renal: Nephrolithiasis (adults, 1% to 3%).

### Compatibility
No information.

### Incompatibility
No information.
Stability  Stable at 2–8°C for 90 days.

Storage  Tight, light-resistant container with sufficient head space for shaking. Store 2–8°C.

Special Comments  The goal is to achieve clinical control of seizures.
There is a paucity of evidence on target serum concentrations in neonates. Therapeutic concentrations are not routinely measured but may be useful to optimise dose and interval. Plasma topiramate concentration reference range 5–20 microgram/mL [1].
