## Clinical Application of Hamilton-Russell Traction

**Sites where Local Procedure applies**: JHCH campus

**This Local Procedure applies to:**
1. Adults  
   - No
2. Children 2-18 years  
   - Yes
3. Neonates – less than 29 days  
   - No

**Target audience**: Clinical staff providing care to paediatric patients in Hamilton-Russell traction

**Description**: Information for clinicians when caring for children requiring Hamilton-Russell traction

---

### Keywords
- Traction, Hamilton-Russell, lower limb, paediatric orthopaedics, fractured femur

### Document registration number
- JHCH 10.3

**Replaces existing document?**: No

### Related Legislation, Australian Standard, NSW Ministry of Health Policy Directive or Guideline, National Safety and Quality Health Service Standard (NSQHSS) and/or other, HNE Health Document, Professional Guideline, Code of Practice or Ethics:
- Relevant Accreditation Criterion e.g. NSQHS Standards/EQuIP Criterion and/or other:
- NSW Ministry of Health Policy PD2014_036 Clinical Procedure Safety
- NSW Ministry of Health Policy PD 2005_406 Consent to Medical Treatment
- NSW Ministry of Health Policy Directive PD 2007_036 Infection Control Policy

### Prerequisites (if required)
- Nil

### Local Procedure note
- This document reflects what is currently regarded as safe and appropriate practice. The procedure section does not replace the need for the application of clinical judgment in respect to each individual patient but the procedure requires mandatory compliance. If staff believe that the procedure should not apply in a particular clinical situation they must seek advice from their unit manager/delegate and document the variance in the patient’s health record.

### Position responsible for the Local Procedure and authorised by
- General Manager CYPFS, Pat Marks

### Contact person
- Clinical Nurse Consultant, Paediatric Orthopaedics

### Contact details
- 0437 913 217

### Date authorised
- 1 August 2017

### This document contains advice on therapeutics
- No

### Issue date
- August 2017

### Review date
- 3 years

1. PURPOSE AND RISKS

This local clinical procedure has been developed to provide instruction to the health clinician and to ensure that the risks of harm to the child associated with application of traction are prevented, identified and managed.

The risks are:
- Ineffective traction
- Neurovascular damage
- Skin damage

The risks are minimized by:
- Clinicians having knowledge of fractured femur management and traction management
- Clinicians seeking assistance if the therapy is outside their scope of practice
- Following the instructions set out in the clinical protocol
- Recognition of the common clinical signs of the risks with neurovascular assessment
- Rectification of the causes of the risks to the patient

Please refer to the problem solving table PAGE xx for further instruction

Risk Category: Clinical Care & Patient Safety

2. GLOSSARY

<table>
<thead>
<tr>
<th>Acronym or Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Counter-traction</td>
<td>A force that is opposing the traction force, which creates a pull on the limb</td>
</tr>
<tr>
<td>Footplate</td>
<td>A square plastic spreader that sits below the bottom of the patient’s foot when in skin traction</td>
</tr>
<tr>
<td>Fracture</td>
<td>A complete or incomplete break in a bone resulting from force</td>
</tr>
<tr>
<td>Hydrocolloid</td>
<td>A malleable adhesive skin dressing applied with the intention of protecting the skin under the skin traction</td>
</tr>
<tr>
<td>Ischaemia</td>
<td>Insufficient blood supply to a part of a body due to a mechanical obstruction</td>
</tr>
<tr>
<td>Pulley</td>
<td>A device that is designed to allow rope to move freely through it in a desired direction</td>
</tr>
<tr>
<td>Skin shearing</td>
<td>A separation between layers of skin resulting from opposing forces</td>
</tr>
<tr>
<td>Skin traction</td>
<td>Traction that is applied via adhesive tape applied on the skin</td>
</tr>
<tr>
<td>Sling</td>
<td>A soft material that is placed under the knee to lift the leg while in traction</td>
</tr>
<tr>
<td>Spreader bar</td>
<td>A metal ‘coat-hanger’ shaped bar that holds the sling in place under the knee and attaches to the traction rope</td>
</tr>
</tbody>
</table>
### Traction
A pulling force on an extremity designed to achieve a desired therapeutic outcome

### Traction frame
A frame that supports pulleys and rope for traction

### Weight bag
A weighted bag that provides a specified amount of pull on the skin traction device

### 3. PROCEDURE

This Procedure does not replace the need for the application of clinical judgment in respect to each individual patient. More comprehensive information is available in the learning resource available on the ward sharedrive.

**Staff Preparation**

It is mandatory for staff to follow relevant: “Five moments of hand hygiene”, infection control, moving safely/safe manual handling, documentation practices and to use HAIDET for patient/carer communication: Hand hygiene Acknowledge, Introduce, Duration, Explanation, Thank you or closing comment.
4. FLOW CHART

This procedure is a clinical therapy and requires mandatory compliance.
5. **INDICATIONS AND BENEFITS OF HAMILTON-RUSSELL TRACTION**

- Achieve and maintain femoral fracture alignment in children and young people who weigh more than 12kg
- Decrease and prevent muscle spasm
- Analgesia

6. **PREPARATION**

It is mandatory to ensure that the parents / carers have received appropriate information to provide informed consent. Patient identification, correct procedure and correct site process must be completed prior to any procedure.

**Prior to Application**

- Prepare the child for the procedure in a developmentally appropriate manner. Plans should be individualised to suit the child in consultation with parents/carers
- It is strongly advised that a child life therapist is called if the procedure occurs during regular business hours
- Assess the child’s skin integrity and skin history, i.e., eczema
- Perform and document a neurovascular assessment
- Ensure all the equipment is available BEFORE administration of analgesia

**Analgesia Management**

- The child should be calm, relaxed and free of pain prior to the procedure
- A definitive analgesia plan must be in place before any physical contact affecting the fracture site is initiated
- A femoral nerve block and Nurse Controlled Analgesia, containing opioid, are recommended
- It is recommended the Acute Pain Service is contacted

**NOTE:**

*Where a nerve block and / or opioid analgesia are contra-indicated in the acute phase of injury, the reason must be clearly documented in the child / young person’s notes with an alternate analgesia plan.*

**Parent Preparation**

Parents and child / young person, where appropriate, should have an initial treatment plan explained to them.

Parents should be given the “A Carer’s Guide to Hamilton-Russell traction” booklet available on the JHCH ward share drives.

It is recommended the parents/carer be included in the procedure and be given a role, such as distraction and comfort. This should be clearly defined prior to the procedure.

**Staff Preparation**

It is mandatory for staff to follow relevant: “Five moments of hand hygiene”, infection control, moving safely/safe manual handling, and documentation practices.
7. **PRESCRIBING TRACTION**

- Traction must be prescribed in the notes by a medical officer.
- The traction and management plan must be written in a clear and unambiguous manner.
- Use metric, not imperial weight measurements, ie, kg not lb.

8. **APPLYING TRACTION**

Traction is a medical therapy. It must be applied by knowledgeable and competent clinical staff. A minimum of two clinicians are required for traction application.

Ensure the procedure is followed. The accuracy with which the traction is applied will determine its effectiveness.

Determine clinician competence. Locate an experienced staff member if necessary. It is recommended traction is applied by clinicians who are experienced with traction application or at least under instruction from an experienced clinician.

The procedure will take approximately 45 minutes.

</tbody>
</table>
Figure 1. Equipment required for traction application.

8.1. Clinical Procedure

Be Aware of Potential Risk Factors

The arrows highlight areas at risk of damage from traction therapy. Constant force and pressure can damage nerves, expose tendons, cause pressure areas over bone and restrict blood flow to the limb.

Figure 2. Arrows identify the areas that are at risk of damage from pressure and force.

Protective Dressings

Cut and place a hydrocolloid dressing on either side of the child’s lower legs. This will protect the skin from
the adhesive tape in the traction kit. It also distributes the force over the skin surface.

![Image of leg with adhesive tape]

**Figure 3.** Hydrocolloid dressings are placed on either side of both legs to protect the skin.
9. PROCEDURAL STEPS

**Traction tape**
- The foot plate should be half a hand space from the end of the foot.
- The tape should be 1cm above the ankles and 1cm below the knee.
- Measure and cut before removing the backing paper from the tape.
- The skin traction should not be stuck to skin above the knee or below the ankles.
- Ensure the tape has no wrinkles.

![Figure 4. Measuring and applying the skin traction.](image)

- Wrap the bandage around the leg firmly, not tight.
- Secure the bandage with tape. Do not place tape circumferentially around the child’s leg.
- Put a pulley onto the rope at the end of the footplate and tie a secure knot.
- Cut the rope.

![Figure 5. Attach the pulley to the foot.](image)
- Measure and cut a piece of rope (approx. 3.5m) and tie one end to spreader bar.
- Place the sling under the knee.
- Ensure the sling does not place pressure on the popliteal fossa (blood supply running down the back of the knee). This can be avoided by placing the sling slightly closer to the femur (proximally).
- Attach the spreader bar and rope to the sling.

![Figure 6. Positioning the sling and spreader bar.](image)
- Position **pulley 1** directly above the patient’s knee and thread the free end of the rope through the pulley
- Thread the rope through **pulley 2** at the foot of the bed
- Thread the rope through **pulley 3** at the patient’s foot
- Thread the rope through **pulley 4** at the end of the bed
- The rope system should look like a triangle with a double line on the base

**Figure 7 & 8. Threading the rope through the pulleys.**
10. APPLYING THE WEIGHT

The amount of weight applied to a limb is very important. The weight should be between 5-10% of the child’s weight. For example, if the child weighs 12kg, the weight should be between 600g–1.2kg depending on the build and muscle tone of the child.

- too little weight is ineffective
- too much weight will cause skin and tissue damage

**NOTE:**

*Weight in excess of 10% will cause skin shearing within weeks.*

*Weight in excess of 20% will cause neurovascular compromise to the limb within days and eventually, ischaemia.*

- Use baby scales to weigh the water bag.
- Write the weight and date on a sticker and attach to the bag.
- Change the weight over gently, steady and gradually or the patient’s quadriceps will go into spasm (which is extremely painful).
- Attach the prescribed weight.
- The weight may be adjusted several times during the first week. Ensure the knot can be undone easily.

![Figure 10. Labelling the weight bag.](image-url)
10.1. **Skin Shearing**

In the picture below, you can see how the tape has pulled the skin towards the weight and has separated the top layers of skin from the lower layers. This is called skin shearing.

Skin breakdown is a problem for children requiring traction therapy because after shearing has occurred:

- The weight must be reduced to prevent further skin breakdown
- The surface area of the skin traction should be increased (by adding a larger piece of thin hydrocolloid under the skin traction)
- The child will not be able to be placed in a plaster
- It could prevent a child from having surgery

![Image of skin shearing](image-url)

*Figure 9. Skin shearing caused by excessive, continuous weight on the skin.*

11. **AFTER APPLICATION**

**Counter-traction**

The patient's body is the counterweight to the weight placed on the limb. Without counter-traction the patient may experience muscle spasm, mal-alignment of bones and they will slide out the end of the bed.

*COUNTER-TRACTION*

*The most important task at the end of the procedure is often forgotten. Without counter-traction, there will no effective traction on the limb.*

The amount of counter-traction required is whatever is needed to stop the patient sliding down the bed.
Once the weight is applied, the child may feel some initial discomfort. This should be temporary.

- The patient’s hip should be slightly flexed (20°).
- The knee should be slightly flexed (10-20°).
- The calf and heel should be slightly elevated off the bed (sometimes this cannot be achieved).

Figure 11. The completed Hamilton-Russell traction set-up.

11.1. Spasms

Sometimes the quadriceps muscle can go into strong spasm, which is very painful. If this occurs, prn medication and some steady, extra manual traction is recommended (this is not to be performed by novice staff) until the spasm decreases.

If the child is still unsettled after medication and manual traction, assess the child and traction. If no problem can be identified - initiate a clinical review.

**ANTI-ROTATION FOAM GUTTER:**

*Call the occupational therapist and ask for an anti-rotation foam gutter to be made for the patient (this is to prevent the foot from turning out – external rotation). This must be done within 7 days of admission to prevent external rotation of the limb.*
Figures 12 & 13. Show how the leg should be positioned in the foam gutter with toes pointing up.
12. MAINTENANCE

SITTING UP IN BED

NOTE:
The hip joint is able to be flexed without affecting the alignment of the femur in most circumstances. The purpose of having a system where rope can slide through pulleys, is to give the patient some reasonable mobility in the bed.

The child should not be allowed to lie flat or have their heads tilted down for long periods, especially when eating. Unless the team has expressed otherwise – all children may sit up in bed as pain permits. Parents should not be told their children cannot sit up.

At the beginning of every shift, the nurse allocated to the child must check the traction is correctly set up. It is not acceptable to assume the traction was correct on the previous shift:
- Check the traction thoroughly
- Make necessary adjustments and changes
- Perform a complete neurovascular assessment

NOTE:
No counter-traction = ineffective traction

Traction must be continuously maintained for the duration of treatment and may not be removed without instructions from the treating team.
- If the child’s skin integrity deteriorates, clinical review is required
- Do not place talc, cream, oil or moisturiser on the affected leg unless it is prescribed on the patient’s medication chart

13. REMOVAL
- Care must be taken when removing adhesive products from skin.
- Take care if using commercial adhesive removal products. Check for broken skin.
- Warm soapy water can be used.
- A warm bath/shower is suggested to remove tape once treatment has been completed.
14. SUMMARY

1. The child’s neurovascular status has been checked and is satisfactory
   - There are no signs and symptoms of neurovascular compromise, or a clinical review has been initiated and the cause has been rectified
   - The skin under the tapes is intact

2. The weight has been checked with electronic scales
   - The weight bag is labelled and dated
   - The weight is equal to or less than 10% of the child’s weight up to a maximum of 2.2kg

3. Counter-traction has been applied
   - The weight is off the floor
   - The child is not sliding down the bed

4. The child is lying in bed in correct alignment with the traction
   - The traction is set-up correctly

5. The child and parents are aware the child may sit up as tolerated

6. The child has a pain score less than or equal to 3/10 using an appropriate paediatric pain scoring tool
   - The child is interactive and is moving without distress
   - The child is interactive and does not become easily distressed when staff approach
   - The child is having simple regular analgesia and PRN opioid analgesia prior to personal care, pressure area care or painful procedures

7. The child is eating and drinking

8. The child has had their bowels open within 2 days
   - The child has laxatives charted

9. The child has an anti-rotation foam gutter placed under their lower leg to control external rotation within 7 days of admission

10. The child and family have had appropriate referrals to allied health staff, which may include:
    - Occupational therapy
    - Physiotherapy
    - Social work
    - Psychology
    - Child life therapy
    - Dietician
## PROBLEM SOLUTION CHECKLIST

| Pressure area behind the knee | Reduce the pressure under the knee and prevent further soft tissue damage | Ensure the traction has been set up correctly  
Ensure the rope is moving freely through the pulleys  
Ensure the position of the sling is correct – the sling should be positioned slightly proximally, i.e., closer to the femur to avoid pressure on the popliteal fossa  
Increase the size of the sling under the knee for older patients  
Ensure the sling fabric is appropriate, avoid use of synthetic materials  
Increase neurovascular observations according to neurovascular assessment protocol  
Request a clinical review  
Request a clinical review within 4 hours | The pressure under the knee has been reduce and further soft tissue damage is prevented  
The pressure area has been staged, documented in the notes and recorded with clinical photography |
| The child is moving and spinning around in the traction (this can be a sign of healing) | Maintain the traction and keep the child safe | Do not prevent the child from moving unless it is unsafe  
If supervision is not effective, the child can be placed into straight leg traction in a cot for the last week of therapy at the surgeon’s discretion | The traction is effective and the child is safe |
16. COMPLIANCE, IMPLEMENTATION AND MONITORING

The clinical areas using the protocol will be given a fact sheet and Orthopaedic CNC will liaise with relevant NUM / Educator regarding the most appropriate roll-out for the specific area. The relevant learning package is available on the ward share drive.

The results of audit will be addressed with the Acute Services Manager
