Alert
Intravenous paracetamol should be considered a high-risk medicine when administered to infants and young children. Use of paracetamol should always be preceded by a comprehensive risk assessment and reviewed every 24 hours. Safety data for paracetamol in extreme preterm infants (< 28 weeks) is limited. It should be used with caution, particularly in the treatment of patent ductus arteriosus.

Indication
Analgesia
Antipyretic
Adjunct to post-operative analgesia
Treatment of patent ductus arteriosus (PDA)

Action
Centrally acting analgesic and antipyretic with minimal anti-inflammatory properties. The mechanism of action of paracetamol in reducing pain is not completely defined. Potential mechanisms include inhibition of central prostaglandin synthesis and inhibition of the cyclooxygenase (COX) isoenzyme, particularly the COX-2 isoform.

Drug Type
Non-narcotic analgesic and antipyretic.

Trade Name
Intravenous: Paracetamol Actavis; Paracetamol ACT; Paracetamol BNM; Paracetamol IV Pfizer; Paracetamol Kabi; Paracetamol-AFT; Paramat
Oral: Dymadon, Febridol, Panadol (Children)

Presentation
IV: 500 mg/50 ml (10 mg/ml) vial
Oral: 100 mg/mL drops

Dosage/Interval
Analgesia/Antipyretic/Adjunct to post-operative analgesia
Oral/Intravenous/Rectal[^1-3]:

</tr>
</tbody>
</table>

*Current/best weight
**Higher maintenance doses (15 mg/kg) in extremely premature infants have been used but there is limited safety data.

Maximum daily dose
60 mg/kg/day

Route
IV, oral, rectal

Preparation/Dilution
Intravenous: Use undiluted. Can be diluted to 2 mg/ml for use in ELBW infants using sodium chloride 0.9% or glucose 5%. If diluted, the solution should be used immediately.

Administration
Intravenous:
Administer over 15 minutes via syringe driver.
Oral:
Can be given with or without feeds. Shake bottle well before measuring dose.
Rectal:
Dilute oral mixture 1:1 with water for rectal doses. Low dose suppositories are not commercially available but can be prepared by selected pharmacy departments. Do not cut suppositories to make part rectal dose.

Monitoring
Monitor hepatic and renal function.

Contraindications
Hypersensitivity to paracetamol, active liver disease.

Precautions
Hepatic impairment, renal impairment, sepsis, dehydration
### Drug Interactions
Paracetamol absorption is increased by substances that increase gastric emptying. Paracetamol absorption is decreased by substances that decrease gastric emptying. Paracetamol may increase chloramphenicol concentrations. The risk of paracetamol toxicity may be increased in patients receiving other potentially hepatotoxic drugs or drugs that induce liver microsomal enzymes such as anticonvulsant agents.

### Adverse Reactions
Vomiting, fever, rash, neutropenia, leucopenia, thrombocytopenia. May cause liver toxicity at high plasma concentrations.

### Compatibility
Sodium chloride 0.9%, glucose 5%

### Incompatibility
Do not mix with any other intravenous fluids or medications.

### Stability
Vials should be used immediately after opening. Any unused solution should be discarded. After dilution in 0.9% sodium chloride or 5% glucose do not store for more than 1 hour (infusion time included).

### Storage
IV: Do not store above 30°C. Do not refrigerate or freeze.
Oral: Store below 25°C.

### Special Comments
Preterm infants may be at increased risk of paracetamol toxicity. Review indications if IV paracetamol is needed for more than 48 hours. Antidote of choice for overdose is acetylcysteine IV infusion. Rectal bioavailability is variable depending on the formulation used. Oral or intravenous routes are preferred.
