Chloral Hydrate

Newborn use only

Alt	I the first and date and the formation stants	
Alert	High risk medicine: risk of causing significant patient harm when used in error.	
	Chloral hydrate should be given by medical personnel in healthcare environment only.	
to discation	Osmolality is 3285 mOsm/kg of water.	
Indication	Sedation for diagnostic/non-painful procedure (e.g. neuroimaging, echocardiography, Brainstem auditory	
	evoked potentials (BERA)).(1-4)	
Asticus	Sedative/hypnotic for short-term use.	
Action	Pure sedative-hypnotic drug without analgesic properties. (4) Exact mechanism of sedation is not yet	
1	known. Chloral hydrate is metabolised to trichloroethanol (TCE), which is responsible for the majority of	
Drug type	the sedative-hypnotic effect.(5) Sedative and hypnotic drug.	
Drug type		
Trade name	Orion Chloral Hydrate Mixture (Perrigo Australia)	
Presentation	Chloral Hydrate Mixture 1 g/10 mL (100 mg/mL) oral liquid, 200 mL	
Dose	25 mg/kg/dose (20-50 mg/kg/dose) (1, 4, 5)	
	For non-painful procedure – administer 30 minutes before the procedure. Do not exceed a total	
	of 50 mg/kg prior to the procedure	
	For sedation in ICU – Avoid repeated and/or prolonged doses. Avoid giving at less than 6 hourly intervals. Not to exceed 100 mg/kg/day.	
	Note: Tolerance may develop after prolonged regular use.	
	Preterm neonates: Avoid any repeat doses in preterm infants and neonates < 7 days old.	
Dose adjustment	Therapeutic hypothermia – No information.	
Dose aujustillelit	ECMO – No information.	
	Renal impairment – Reduce dose in mild impairment and avoid in significant impairment.	
	Hepatic impairment – Reduce dose in mild impairment and avoid in significant impairment.	
Maximum dose	50 mg/kg per procedure	
Total cumulative	100 mg/kg/day	
dose	155 116, 16, 164	
Route	Oral or gastric.	
Preparation	Syrup – 100 mg/mL (osmolality is 3285 mOsm/kg of water). Oral preparation should be diluted 1:3-1:5	
•	with sterile water or administered after feeding to reduce gastric irritation.	
Administration		
Monitoring	Observe for respiratory depression, apnoea, bradycardias, and hypotension.	
	In preterm infants up to 44 weeks corrected age - observations should continue for at least 24 hours	
	after dose administration.(1)	
	Residual agitation may occur for several hours.(4)	
Contraindications	Significant hepatic and/or renal disease.	
	Severe cardiac disease.	
	Gastritis, oesophagitis or gastric or duodenal ulcers.	
	Porphyrias.	
	Obstructive sleep apnoea.	
	Previous history of hypersensitivity reaction to chloral hydrate or to any of the excipients.	
Precautions	Reduce dose in mild hepatic and renal impairment.	
	Avoid prolonged use and abrupt withdrawal thereafter.	
	Administration with other CNS depressants such as opioids, benzodiazepines or barbiturates may	
	produce excessive sedation.	
	Indirect hyperbilirubinaemia may occur after prolong use because TCE and bilirubin compete for hepatic	
	conjugation.	
Dura inter	Use cautiously in preterm infants due to the risk of respiratory depression.	
Drug interactions	Additive effect with opioids, barbiturates, benzodiazepines leading to respiratory depression.	
	May produce a transient increase in response to warfarin due to displacement of warfarin from its	
	protein binding site.	
	Avoid concomitant use of furosemide – intravenous furosemide after chloral hydrate has been reported	
	to produce diaphoresis, flushing, changes in blood pressure and tachycardia in adults and older children.	
	May displace phenytoin from protein binding sites and reduce its rate of elimination.

Chloral Hydrate

Newborn use only

Respiratory depression and bradycardia. Gastric irritation with nausea and vomiting. Reduced oral intake.(1) In premature infants , episodes of bradycardia may occur for up to 24 hours after a dose.(1) Hyperbilirubinemia. Metabolic acidosis (from accumulation of the metabolite, trichloroacetic acid). Paradoxical excitement may occur. Tolerance with prolonged administration. Prolonged administration or acute overdose can cause neurologic, respiratory and myocardial depression; cardiac arrhythmia and bladder atony. Serious adverse events including death/permanent neurologic injury have been reported in children i review of adverse event care reports from the adverse drug reporting system of the Food and Drug Administration, the US Pharmacopoeia, and the results of a survey of paediatric specialists.(6) Compatibility Not applicable. Storage Store below 25°C. Protect from light. Excipients Sucrose, citric acid, sodium citrate, saccharin sodium, glycerol, methyl hydroxybenzoate, ethanol 2.49 v/v, propylene glycol, natural peppermint flavour and purified water. Special Chloral hydrate has no analgesic properties, excitement may occur in patients with pain. Despite being restricted in some countries (e.g. France) as a result of potential carcinogenicity, the American Academy of Pediatrics has judged the evidence insufficient to avoid single doses of chloral hydrate for this reason alone.(4, 7) Evidence Efficacy Chloral hydrate is effective for sedation for painless procedures in children. (2, 8)(Level II, Grade C). The data in neonates are insufficient to promote the regular use of chloral hydrate as a sedative for neonates in intensive care. (9) (Level III, Grade C). Dosing: There is paucity of information regarding dosage and dosing intervals in neonates. The sugged dose in this formulary was based on 2 prospective observational clinical and pharmacologic evaluation chloral hydrate in neonates. (1, 5) Allegaert et al showed achievement of adequate sedation for BERA (Brainstem auditory evoked potentials) with

chloral hydrate in neonates.(1, 5) Allegaert et al showed achievement of adequate sedation for BERA (Brainstem auditory evoked potentials) with 30 mg/kg/dose of chloral hydrate in preterm infants.	
(Brainstem auditory evoked potentials) with 30 mg/kg/dose of chloral hydrate in preterm infants.	OT
bradycardic episodes both before and after chloral hydrate administration in these infants, but the	
frequency and duration of bradycardic episodes were more for up to 24 hours after chloral hydrate.	
Reimche et al administered 20-50 mg/kg/dose of chloral hydrate with repeat doses at 6-24 hour inter	عادر
and achieved adequate sedation and improvement in irritability in neonates without any significant	/ais
impact on blood pressure, heart rate and respiratory rate.(5) Alternative doses, e.g. 8-10 mg/kg/dose	
have been suggested but not substantiated by any evidence.	
Dilution: Medications added to milk feeds have the potential to raise osmolality, causing feed	
intolerance and necrotizing enterocolitis.(10) It is recommended to calculate the diluent volume to ke	en
the osmolality ≤ 450 mOsm/kg.(10-12)	- -
Safety	
Chloral hydrate in preterm infants can cause post-procedural bradycardic events and decreased oral	
intake in the 24 hour interval period after the administration.(1) Trichlorethanol (TCE) and trichloroac	etic
acid (TCA), active metabolites of chloral hydrate were detected in blood up to 84 hours in neonates of	
chloral hydrate. Indirect bilirubin was significantly elevated suggesting TCE actively competes with	
bilirubin for glucuronidation in liver.(5) Prolonged use warrants monitoring of serum bilirubin level.(5)	
Chloral hydrate overdose may produce cardiac arrhythmias including torsades de pointes. (13)	
There are no studies pertaining to chloral hydrate associated carcinogenicity in humans. (7)	
Death/severe permanent neurologic injuries have been reported in children, with sedatives in non-	
hospital based settings, particularly when the sedatives were given by health professionals not trained	
advanced resuscitation skills.(6)	in
Pharmacokinetics	l in
Chloral hydrate is rapidly and effectively absorbed via the oral route and is immediately metabolised	l in
liver enzymes (alcohol dehydrogenase) to the active hypnotic metabolite trichloroethanol (TCE). It is

Newborn use only

eventually excreted in the urine after glucuronidation in the liver. Plasma concentration peaks within 30		
minutes to an hour. It is also metabolised to trichloroacetic acid (TCA). Both TCE (8–64 hours) and TCA		
(days) have long plasma half-lives in neonates and accumulate with repeated doses.(5)
