Doses up to 100 microgram/kg/hour titrated to Neonatal Abstinence Syndrome scores. Doses up to 100 microgram/kg/hour have been used in newborns; however this was associ with an increase in the duration of mechanical ventilation. IV IV Infusion: SINGLE STRENGTH Prescribed amount Infusion rate 1 mg/kg morphine and make up to 50 mL 1 mL/hour = 20 mic

Newborn use only

	concentration of 1 mL/hour = 40 microgram	pride 0.9% to make a final volume of 50 mL with /kg/hour.	
	IV bolus dose from double strength solution	-	
	1-STEP DILUTION for IV infusion	(consider for weight 2 kg and over)	
	IV Infusion: SINGLE STRENGTH		
	Prescribed amount Infusion rate		
	1 mg/kg morphine and make up to 50 mL	1 mL/hour = 20 microgram/kg/hour	
		and add glucose 5% or glucose 10% or sodium chloride concentration of 1 mL/hour = 20 microgram/kg/hour. on: 2.5 mL = 50 microgram/kg.	
	IV Infusion: DOUBLE STRENGTH		
	Prescribed amount	Infusion rate	
	2 mg/kg morphine and make up to 50 mL	1 mL/hour = 40 microgram/kg/hour	
	Draw up 0.2 mL/kg (10mg morphine in 1mL) and add glucose 5% or glucose 10% or sodi 0.9% to make a final volume of 50 mL with a concentration of 1 mL/hour = 40 microgra For IV bolus dose from double strength solution: 1.25 mL = 50 microgram/kg.		
	IV BOLUS and PRE-MEDICATION FOR INTUBATION		
		6 mL sodium chloride 0.9% to make a final volume of 10	
	mL with a concentration of 500 microgram/m		
Administration	CONTINUOUS IV INFUSION: Via syringe drive	r.	
	IV BOLUS : Administer over 5 minutes. Flush with 1 mL sodium chloride 0.9% before and after injection. Rapid IV administration may increase adverse effects.		
	PRE-MEDICATION FOR INTUBATION: As abo of action; however for maximum effect wait :	ve for IV bolus. Wait a minimum of 5 minutes for onse 15 minutes after giving the dose.	
Monitoring	All patients should have cardiorespiratory monitoring and be carefully observed, particularly if they		
	are breathing spontaneously. Respiratory depression/apnoea can be reversed with naloxone.		
	Naloxone is contraindicated in opioid dependent infants.		
	Observe for urinary retention, abdominal distension or delay in passage of stool.		
<u> </u>	Withdraw slowly following prolonged use.		
Contraindications	Hypersensitivity to morphine or any excipients.		
Precautions	Potentially toxic serum concentrations of morphine may occur in infants with hypoxic ischaemic		
	encephalopathy with moderate hypothermia and infusion rates >10 microgram/kg per hour. [3] Use with caution in patients with hyporsensitivity reactions to other opioids		
	with caution in patients with hypersensitivity reactions to other opioids. Hypotension and bradycardia. Respiratory depression.		
	Transient hypertonia. Convulsions.		
	Ileus and delayed gastric emptying time. Urinary retention. Renal or hepatic impairment.		
	Tolerance may develop after prolonged use – wean slowly.		
Drug Interactions		potentiates effects of opioids, increasing risk of	
	respiratory depression, profound sedation or		
Adverse Reactions		ry depression (levels above 20 ng/mL); decreased	
	gastrointestinal motility, hypotension at high

	remifentanil, sodium nitroprusside, tacrolimus, tigecycline, tirofiban, tobramycin,	
	trimethoprim-sulfamethoxazole, vancomycin, vecuronium, zidovudine.	
Incompatibility	Fluids: Morphine may precipitate out of solution when the final pH is greater than 6.4.	
	Drugs :	
	Morphine hydrochloride – esomeprazole	
	Morphine sulfate – Aminophylline, azathioprine, azithromycin, flucloxacillin, folic acid,	
	ganciclovir, indometacin, pentamidine, pethidine, promethazine, sodium nitrite, thiopental	
	sodium.	
Stability	Diluted solution for continuous IV infusion is stable for 48 hours.	
Storage	Ampoule: Store below 25°C. Protect from light.	
	Discard remainder after use (in line with schedule 8 drug legislation).	
	Store in Dangerous Drug (DD) safe and record use in DD register.	
Special Comments	Prolonged use (> 5–7 days) may be associated with dependence.	
	Morphine hydrochloride and sulfate contain approximately equivalent amounts of morphine base	
	per milligram.	
Evidence	Efficacy:	
	Premedication: Morphine 0.2 mg/kg bolus did not reduce the occurrence of severe hypoxia with	
	bradycardia during intubation, in comparison with placebo.[5] [LOE II] Morphine 0.1 mg/kg –	
	atropine 10 microgram/kg and suxamethonium 1 mg/kg premedication reduced the total time and	
	number of attempts taken to achieve successful nasotracheal intubation of neonates compared to	
	awake intubation;[6] [LOE II] Morphine 0.1 mg/kg – atropine 10 microgram/kg and suxamethonium

	weighing the benefits of acute interventions against the potential for long-term harm.[28]
	have been noted. Morphine use should continue to be based on clinical judgment, carefully
	There is no compelling evidence to support severe long-term harm, but subtler behavioural changes
	Safety
	Potentially toxic serum concentrations of morphine may occur with moderate hypothermia and infusion rates >10 microgram/kg per hour [3].
	serum morphine concentrations when morphine infusion rates are based on clinical state.
	Infants with hypoxic ischemic encephalopathy have reduced morphine clearance and elevated
	concentrations of ≤10 microgram/L [26, 27].
	More restricted dosing recommendations have been suggested in neonates targeting morphine
	microgram/kg/hour; 31-90 days: 10 microgram/kg/hour [2].[LOE II GOR B]
	reduced with the following modelled rates: 0-7 days: 5 microgram/kg/hour; 8-30 days: 5
	non-cardiovascular surgery are: 0-7 days: 10 microgram/kg/hour; 8-30 days: 15 microgram/kg/hour; 31-90 days: 20 microgram/kg/hour [1]. For infants after cardiovascular surgery clearance was
	Lynn et al estimated morphine infusion rates to achieve a steady-state concentration ≤ 20 ng/mL for
	[27]. (LOE II GOR B)
	were 7 microgram/kg/h in full-term neonates; 10 microgram/kg/hour in infants >4 weeks of age
	postoperatively than older neonates. The recommended dosage for continuous morphine infusions
	morphine concentrations suggested neonates <7 days require significantly less morphine
	23.4) microgram/kg/hour in older infants ($p < 0.001$) [26]. Also in postoperative term infants,
	was 4.4 (4.0-4.8) microgram/kg/hour in postoperative term neonates <10 days versus 14.4 (11.3-
	Pharmacodynamic assessment found median (IQR) average morphine infusion rate for pain relief in
	morphine half-life is age related, reported as around 9 hours in ventilated preterm infants [23, 24], 6 hours in term infants [24, 25] and 2 hours for infants beyond 11 days age [24].
	Concentrations above 20 ng/L have been associated with respiratory depression [2]. The mean morphine half-life is age related, reported as around 9 hours in ventilated preterm infants [23, 24]
	Effective morphine concentrations in the range of 10–20 ng/L have been reported [1, 22].
	Pharmacodynamics / Pharmacokinetics:
	mg/kg/day [20]. Estimated oral morphine bioavailability 48.5% in neonates [21]. (LOE IV GOR C)
	19]. [LOE IV] Recommended oral dose for initial treatment of NAS in opioid dependent infants 0.5
	for NAS secondary to opioids although its use has been reported including for seizure control [18,
	Neonatal abstinence syndrome secondary to opioids: There are no trials of intravenous morphine
	infusion [17]. [LOE II]
	microgram/kg/hour. [16]. [LOE II] Postoperative morphine use can be reduced by paracetamol
	continuous infusion to a targeted morphine concentration of 20 ng/ml provided more reliable analgesia than an intermittent bolus doses as needed. The average infusion rate was 20.6 ± 8.7
	30 microgram/kg per 3 hours were equally effective and safe in neonates. (LOE II] A morphine
	postoperative patients. A continuous morphine 10 microgram/kg per hour or intermittent morphine
	Postoperative pain relief: Continuous and intermittent morphine infusions have been trialled in
	[Consensus statement for the International Evidence-Based Group for Neonatal Pain] [4].
	placement, endotracheal intubation and suction; chest tube insertion and for ventilated infants.
	intravenous opioid infusion (morphine sulfate or fentanyl citrate) for: central venous line
	monitored and carefully observed, particularly if they are breathing spontaneously. Consider slow
	with its use. The opioid doses are only applicable for opioid-naive patients. All patients should be
	advised that neonatal intensive care units use only 1 opioid analgesic agent to ensure familiarity
	Morphine sulfate 0.05-0.1 mg/kg intravenously; <i>Infusion Dose -</i> 0.01-0.03 mg/kg per hour. It is
	Analgaesia: Recommended procedural analgesic doses for neonates are: Intermittent Dose -
	required, morphine is safer than midazolam [11]. (LOE I GOR B)
