## Indometacin (Indomethacin)

Newborn use only

Alert	From April 2016, the international spelling for Indomethacin has been changed to Indometacin.					
Indication	Closure of patent ductus arteriosus (PDA)					
	-	Prevention of severe intra-ventricular haemorrhage.				
Action	Prostaglandin inhibitor. Prostaglandins are important in maintaining ductal patency in utero.					
Drug type		Non-steroidal anti-inflammatory drug (NSAID).				
Trade name		Indocid PDA, Indomethacin Agila				
Presentation	1 mg powder for reconstitution.					
Dose	IV					
DOSC	Single daily dose as follows:					
	Post-natal Age	Day 1	Day 2	Day 3		
	< 48 hours	0.2 mg/kg/dose	0.1 mg/kg/dose	0.1 mg/kg/dose		
	$\geq$ 48 hours	0.2 mg/kg/dose	0.2 mg/kg/dose	0.2 mg/kg/dose		
Dose adjustment		012				
Therapeutic	Not applicable					
hypothermia		to suggest dose adjustme	ents			
ECMO	Insufficient data to suggest dose adjustments. Refer to contraindications section.					
Renal impairment		Insufficient data to suggest dose adjustments.				
Hepatic impairment	וויזעוווכורות עמנמ נס סעצבכזר עסיב מטועזרוווכוונא.					
Maximum dose	0.2 mg/kg	0.2 mg/kg				
Total cumulative	0.6 mg/kg					
dose	0,0					
Route						
Preparation						
	Add 1 mL of WFI to the 1 mg powder for reconstitution. Then draw up 1 mL (1 mg) and add 9 mL WFI to make a final volume of 10 mL with a concentration of 0.1 mg/mL.					
Administration	IV: Over 20–-30 minutes.					
Administration	10.000120 301	innuces.				
	Inspect visually fo	or particulate matter and	discolouration prior to admi	inistration		
Monitoring	Inspect visually for particulate matter and discolouration prior to administration. Monitor urine output, cardiovascular status, serum biochemistry, renal function and for signs of					
	bleeding.					
Contraindications	Renal impairment: urine output <1 mL/kg/hour during the preceding 8 hours; serum creatinine ≥140					
$\mu$ mol/L; blood urea nitrogen >14 mmol/L. (17)						
	Serious infection, active bleeding, thrombocytopenia or coagulopathy, necrotising enterocolitis (NEC) or					
	intestinal perforation, significant renal dysfunction, ductal dependent congenital heart disease and					
	pulmonary hypertension.					
Precautions	Indomethacin is associated with transient renal impairment. Late and prolonged treatment of the ductus					
	arteriosus with indomethacin may increase the incidence of NEC.					
Drug interactions	Aminoglycosides: Dose may need to be modified if indomethacin affects renal function.					
	Digoxin: Reduces indomethacin volume of distribution – increased dose may be required.					
	Diuretics: Use of frusemide in combination with indomethacin may increase the incidence of renal					
	impairment.					
	Systemic corticosteroids: Intestinal perforation has been described in infants treated with early					
	dexamethasone and indomethacin.					
Adverse reactions	Prophylactic indomethacin is associated with oliguria/anuria.					
	Treatment of the ductus arteriosus with indomethacin and prolonged courses of indomethacin are					
	associated with NEC.					
	Gastrointestinal perforation and possibly bleeding.					
	Extravasation.					
Compatibility	Fluids: Sodium chloride 0.9%, water for injection.					
	Y site: Atropine, Cephazolin, cefotaxime, ceftazidime, clindamycin, dexamethasone, digoxin, fentanyl,					
	fluconazole, frusemide, heparin, hydrocortisone, benzylpenicillin, potassium chloride, sodium					
	bicarbonate.					
Incompatibility	Fluids: Glucose 7.5%, Glucose 10%					
				nam, benztropine, buprenorphine,		
	calcium chloride,	calcium gluconate, chlor	promazine, dobutamine, dop	pamine, erythromycin, esmolol,		
	•		(Indomethacin)	Bage 1 of 2		

## Indometacin (Indomethacin)

Newborn use only

	gentamicin, glycopyrrolate, haloperidol lactate, hydralazine, labetalol, magnesium sulfate, metaraminol, midazolam, morphine sulfate, noradrenaline, ondansetron, pentamidine, pethidine, phenylephrine,
	promethazine, protamine, suxamethonium, tobramycin, vancomycin, vasopressin, verapamil.
Stability	Discard unused portion. Diluted solution is stable for 6 hours at room temperature.
Storage	Store unopened vials at room temperature (20–25°C)
Excipients	
Special comments	
Evidence	Effectiveness: Prophylactic intravenous indomethacin in preterm infants has short-term benefits including a reduction in the incidence of symptomatic PDA, PDA surgical ligation and severe intraventricular haemorrhage (IVH). However, there is no evidence of effect on mortality or neurodevelopment (5) (LOE I GOR C). Safety: Prophylactic indomethacin is associated with oliguria but not an increased creatinine or gastrointestinal side effects.
	Indomethacin for asymptomatic patent ductus arteriosus: Treatment of an asymptomatic PDA with indomethacin reduced the incidence of symptomatic PDA, duration of supplemental oxygen, with no effect on mortality, IVH, retinopathy of prematurity, length of ventilation, or NEC. Safety: Renal and gastrointestinal toxicities and long term neurodevelopment were not reported (10) (LOE I, GOR C).
	Indomethacin versus ibuprofen for the treatment of patent ductus arteriosus in preterm or low birth weight infants: Indomethacin is as effective as ibuprofen in closing a PDA (6). Safety: Indomethacin increases the risk of NEC and transient renal insufficiency compared to ibuprofen.
	Summary recommendation: Ibuprofen is as effective as indomethacin in closing a PDA and currently appears to be the drug of choice. Ibuprofen reduces the risk of NEC and transient renal insufficiency compared to indomethacin6 (LOE I GOR B).
	Dose: Indomethacin given in total amounts for the prolonged course (6–8 doses) of 0.6–1.6 mg/kg compared with the short course 0.3–0.6 mg/kg (2–3 doses): There was no difference in efficacy between a short or prolonged course of indomethacin (LOE 1, GOR C). Safety: A prolonged course is associated with an increased risk of NEC but a decreased incidence of renal function impairment (oliguria and increased serum creatinine) 7 (LOE I, GOR B). Pharmacokinetic studies reported substantial interpatient variability (11, 12) in clearance related to postnatal age. (2, 12) Bolus infusions of indomethacin are associated with alterations in renal, mesenteric and cerebral blood flow (13). Ductus arteriosus closure rates are related to dose and indomethacin concentrations.(11,14).
